The Ulta Beauty Problem

our work entails designing and delivering a business intelligence application that serves a major retail enterprise. The system

first, install the plotly visualization library.

```
!pip install plotly-geo
    Requirement already satisfied: plotly-geo in /usr/local/lib/python3.10/dist-packages (1.0.0)

Double-click (or enter) to edit

!pip install pandas

Requirement already satisfied: pandas in /usr/local/lib/python3.10/dist-packages (1.5.3)
    Requirement already satisfied: python-dateutil>=2.8.1 in /usr/local/lib/python3.10/dist-packages (from pandas) (2.8.2)
    Requirement already satisfied: pytz>=2020.1 in /usr/local/lib/python3.10/dist-packages (from pandas) (2023.3.post1)
    Requirement already satisfied: numpy>=1.21.0 in /usr/local/lib/python3.10/dist-packages (from pandas) (1.23.5)
    Requirement already satisfied: six>=1.5 in /usr/local/lib/python3.10/dist-packages (from python-dateutil>=2.8.1->pandas) (1.16.0)
```

our system depends on the use of the pandas and numpy libraries.

```
import pandas as pd
import numpy as np
```

Importing pandas and numpy as well as naming them. Pandas is a useful tool that provides easy to use data structures and anylasis tools for python. Numpy is a dataframe as well as a libary for python to utilize large multi dimesnional arrays and matrices. Pandas is built upon the numpy mainframe so both are usually used in conjuction.

```
url = 'https://raw.githubusercontent.com/stefanbund/py3100/main/ProductList_118.csv'
url_m = 'https://raw.githubusercontent.com/stefanbund/py3100/main/ProductList_118.csv'
url_m = 'https://raw.githubusercontent.com/stefanbund/py3100/main/matrix.csv'
```

Naming the two urls that the projects data will be sourced from. In this case it is sourced from the given github repository.

```
df_m = pd.DataFrame()

df_m = pd.read_csv(url_m) #make a pandas dataframe
```

creating a command named df_m "data frame matrix" to create a dataframe from the source named 'url_m'

```
df_m
```

3 rows × 25 columns

per store, the quartile values

creating a command "df_3" that is able to list the 1st,2nd, and third quartiles from the data included in the dataframe. This is useful to get a general basis of what is good or poor performance. A new dataframe is then created using the requested data.

```
1 = df_3.T.columns #transpose, T
1
Float64Index([0.25, 0.5, 0.75], dtype='float64')
```

transpose is able to turn columns into rows as well as rows inro columns. This allows for a statistical anlysis based on quartile percents.

Double-click (or enter) to edit

```
df_3.T.mean()

0.25 3535.24

0.50 5826.36

0.75 7953.00

dtype: float64
```

define the global quartile boundary, per q

A calculation of the mean that fits between the three quartile variables. for example if a store were to be above 7953 it only be in the upper 25 percent of performing stores.

```
df_3.T[0.25].mean()
3535.24
```

Double-click (or enter) to edit

classification for the mean of 25th percentile.

```
df_3.T[0.5].mean()
5826.36
```

classification for the mean of 50th percentile.

```
df_3.T[0.75].mean()
7953.0
```

Double-click (or enter) to edit

classification for the mean of 75th percentile.

```
kk = df_3.T.mean()
kk #series

0.25     3535.24
0.50     5826.36
0.75     7953.00
dtype: float64
```

what percentage of displays are at or below the 25th quartile, per store? exercise

python code that utilizes the original matrix created to measure how many variables are underneath the 25th quartile. Then express that as rows. the shape portion of the code is a measure of how many items are in a row.

```
# n =
((df_m.iloc[:, 1:] \leftarrow kk[0.25]).sum(axis=1) / df_m.shape[1]) * 100
# print(round(n))

commands for importing number to utilize the dataframe that had been created earlier as well as plotly express. Plotley express is a Api for creating figures in python. Here we are using a command to create a chloropeth with our desired qualities. It is highly versatile and user freindly to create various graphical repesentations of data.
